

# MINIMIZE LOSS AND ENERGY COSTS

Energy costs and loss of grain value from over-drying and spoilage can easily eat away at your bottom line. BinManager's controlled natural air drying technology dries grain to targeted moisture content with precise accuracy. And because the bin's fans and heaters are programmed to only run on an as-needed basis, annual energy savings can add up.

# BINMANAGER<sup>®</sup> AND SOYBEAN STORAGE MANAGEMENT

## HOW DOES BINMANAGER WORK?

BinManager intelligently monitors the moisture content and temperature of the grain inside your bin as well as the outside air, which automatically enables the system to know the optimal times to run heaters and fans. Condition readings are taken on a frequent basis, and data from the in-grain sensors across one or multiple bins is synched to one user-friendly online interface that can be accessed from any web-enabled device. There, you can get a comprehensive understanding of what really is happening to your stored soybeans. And the system will even alert you to potential problems via e-mail or text message.

### In addition to financial savings, BinManager offers the following benefits:

- Internet-based software allows you to manage multiple bins and multiple sites, so you always know the condition of your grain.
- The technology provides clear data to guide a successful harvest and storage plan.
- An unlimited amount of temperature and moisture cables gives you a clear, comprehensive picture of what's going on in your bins.
- BinManager saves you time and energy, while increasing your bushels, profits and peace of mind.

## MAXIMIZE YOUR YIELD

All too often, soybeans are loaded into the grain bin over-dried to start and face the risk of becoming even more dry during storage. BinManager has the unique ability to rehydrate the beans and bring them to a profitable targeted moisture content. And that means more weight, more profit and a higher return on investment for your farm.

### REHYDRATION WITH BINMANAGER

Evaporated water not in the grain directly represents money loss from excessive shrink due to an over-dried harvest

Level expansion with BinManager rehydration

**1 YEAR MONEY GAIN** ▶ \$4,635 to \$5,078\*

**5 YEAR ROI** ▶ \$13,775 to \$15,990\*

\*Calculated using \$11/bu price and annual fan run cost of \$85 to \$1,028 (depending on fan size)  
BinManager cost is removed from profit to form ROI

## JOIN OUR RANKS OF SATISFIED CUSTOMERS

Our soybean customers are consistently satisfied with the difference BinManager has made to their operation.

“It's the most efficient system that I've ever dreamed of that could put moisture back into soybeans. I think it's going to pay for itself extremely fast.”

– Chuck Myers

“When I took the grain out of the bin and hauled it to the elevator, it was all within a half-point from top to bottom and one-fourth point from my target moisture...I couldn't believe the energy savings!”

– John Krueger
